Executive Summary
Resource-based industries are a vital part of a strong Northern Ontario economy. The discovery of significant mineral deposits in the Ring of Fire, an area in Ontario’s Far North, presents major development opportunities in mining that will contribute to the Ontario economy. Development of the mineral deposits in the Ring of Fire area will create jobs and better position the Northern Ontario economy for future sustained growth.

However, human resources challenges threaten this growth potential. Labour market pressures vary considerably among the provinces and territories in Canada — reflecting differences in commodities, the mix of exploration and mining activities, and the size of the labour pool. Research by the Mining Industry Human Resources Council (MiHR) has demonstrated that regional analysis of the mining labour market is very valuable; it provides important intelligence about local industry conditions, labour market pressures, and predictions of future needs.

This report was prepared for the Northwest Training and Adjustment Board and deals with the geographic regions of the Kenora and Rainy River Districts. Developed from a provincial forecast for Ontario, the forecast presented here was customized to capture the unique conditions and context of mining in the Kenora and Rainy River Districts. This is one of six separate reports on districts across Northern Ontario — the other five include: Sudbury; Cochrane and Timiskaming; Nipissing; Algoma; and Thunder Bay. The goal is to empower these districts and others across Ontario to create effective labour market and workforce planning strategies — based on an understanding of mining operations and challenges specific to their region.
The Kenora and Rainy River Districts represent 40 per cent of the Ontario provincial landmass, accompanied by the lowest population density and low rates of population growth. Primary industries like forestry, exploration and mining are the major employers in the area. With new mining and exploration activities the economic development prospects in the Kenora and Rainy River Districts are promising. However lack of infrastructure combined with geographical factors like untamed wilderness, frozen muskeg and boreal forests will pose challenges to future economic development. Moreover, the Kenora and Rainy River Districts are facing population decline. According to the 2011 Census, the population of the Kenora District decreased by 11 per cent compared to the previous Census data. In the near future this demographic change coupled with high youth out migration will contribute significantly to the HR challenges in the District.

Furthermore, the Kenora and Rainy River Districts are home to 65 Aboriginal communities; making it the only district in Northern Ontario with a high concentration of Aboriginal people in an urban setting. The Aboriginal population in the Kenora District is 40 per cent of the total population and has lower levels of education as compared to the general population. Over 50 per cent of Aboriginal people aged 25 to 34 in the Kenora and Rainy River Districts do not have high school diplomas. In the near future the Kenora District will face labour shortages as well as skills shortages due to the lack of experienced and trained people in the labour force. With expansion in mining and exploration activities and remoteness of the exploration and mining sites, local employers that are already facing skills and labour shortages are relying on workers from other regions. Hence fly in and fly out and commuter workforces are common in the Districts.

MiHR research indicates employment in the mining sector is more cyclical than in many other industries in Canada. Previous labour market forecasts produced by MiHR show that despite this cyclical nature, future hiring requirements will be quite significant across Canada, even under contractionary (i.e., poor economic outlook) scenarios. These same trends are evident in the labour market forecasts for the Kenora and Rainy River Districts.

This report uses MiHR’s labour market forecasting system, which was developed to produce forecasts of employment and hiring requirements in the mining industry at the national and provincial /territorial levels. This model uses a variety of factors to predict changes in employment in the mining and minerals exploration industry, including commodity prices, productivity factors and demographic data. The forecasts are prepared for two-, five-, and ten-year time horizons, and are presented using three economic scenarios — contractionary, baseline and expansionary. Hiring requirements represent the sum of net change in employment and replacement requirement due to retirement and other exists from the labour force.

MiHR forecasts for Ontario were modified to produce regional forecasts for each of the six areas in question for these reports. Sub-provincial forecasting presents a number of unique challenges that do not exist in preparing forecasts at provincial and national levels. To address these challenges in its methodology, MiHR adapted a number of provincial assumptions to produce district-specific data. Adaptation was based on the outcomes of surveys; key informant interviews conducted as part of this research; and information from each planning board’s own research and data collection activities within the Districts.

2 The development of the forecast system was supported, in part, by funding from the Government of Canada and with financial contributions and guidance from the mining and minerals exploration industry stakeholders across Canada.
3 The forecasts presented herein provide custom estimates for the region, based on current information available at the time of production.
Table 1a shows forecasted hiring requirements for the Kenora District mining industry; and Table 1b shows forecasted hiring requirement for the Rainy River District mining industry. MiHR defines the industry as including all phases of the mining cycle from prospecting and exploration, advanced development and construction, support services for exploration and mining, extraction, mineral processing, and closure, care and maintenance. Forecasts are presented for three scenarios — baseline, contractionary and expansionary. Mining sector employment in the Kenora District was estimated at almost 4,289 workers in 2012. Under the baseline scenario, the projected cumulative hiring requirements over the next 10 years will be approximately 3,290 workers. A projected 3,050 workers would be needed in a contractionary scenario, and 3,550 workers in an expansionary scenario. Mining sector employment in the Rainy River District was estimated at almost 1,555 workers in 2012. Under the baseline scenario, the projected cumulative hiring requirements over the next 10 years will be approximately 640 workers. A projected 410 workers would be needed in a contractionary scenario, and 860 workers in an expansionary scenario.

Based on discussions with stakeholders, the mining industry in the Kenora and Rainy River Districts faces a number of potential HR issues. These include: demographic population shrinkage; challenges related to attracting, training and retaining local Aboriginal workforces; issues in creating sustainable communities locally, due to reliance on mobile workforces; attracting local youth to mining professions to reduce youth out migration; poor image of the industry; shortages of skilled labour; and challenges in attracting immigrants to the Districts.
Background and Scope
Human resources challenges are one of the greatest threats to the future competitiveness of the Canadian mining industry. A number of factors contributed to these significant HR challenges, including the looming retirement of the baby-boom generation, the struggle to attract and engage younger workers, and an under-representation of diverse groups such as Aboriginal peoples, women and new Canadians. While the industry has made tremendous strides in addressing these issues, finding skilled workers is becoming more difficult, and competition continues to increase across all sectors of the economy.

Labour market pressures vary considerably among the provinces and territories — reflecting differences in commodities, the mix of exploration and mining activities, and the size of the labour pool. Research by the Mining Industry Human Resources Council (MiHR) has demonstrated that regional analysis of the mining labour market is very valuable; it provides important intelligence about local industry conditions, labour market pressures and predictions of future needs.

This report was prepared for the Northwest Training and Adjustment Board (NTAB) and deals with the geographic region of the Kenora and Rainy River Districts. Developed from a provincial forecast, the forecast presented here was customized for the unique conditions and context of mining in the Kenora and Rainy River Districts. This is one of six separate reports on districts across Northern Ontario — the result of a cutting-edge partnership between MiHR and six Northern Ontario workforce planning boards. Each report presents a regional-level outlook that follows MiHR’s labour market forecasting model.

Reports have also been prepared for five other Northern Ontario regions: Sudbury, Cochrane and Timiskaming, Nipissing, Algoma, and Thunder Bay. The goal is to empower these districts and others across Ontario to create effective labour market and workforce-planning strategies — based on an understanding of mining operations and challenges specific to their region.

MiHR’s Labour Market Forecasting System

This report uses MiHR’s labour market forecasting system, which was developed to produce forecasts of employment and hiring requirements in the mining industry at the national and provincial/territorial levels. This model uses a variety of factors to predict changes in employment in the mining and minerals exploration industry, including commodity prices, productivity factors and demographic data. The forecasts are prepared for two-, five-, and ten-year time horizons, and are presented using three economic scenarios (contractionary, baseline and expansionary).

4 Ernst and Young, Business Risks Facing Mining and Metals, 2010.
5 The development of the forecast system was supported, in part, by funding from the Government of Canada and with financial contributions and guidance from mining and minerals exploration stakeholders from across Canada.
The data inputs to the MiHR forecasting model include Statistics Canada data (including, but not limited to, Census and Labour Force Survey), inputs on several economic indicators, and Natural Resources Canada data. This was supplemented and adjusted using primary research sources—region-specific analysis, mining sector employer surveys and key informant interviews). A general description of the forecast methodology can be found in Appendix A, along with an explanation of the underlying assumptions used to generate the Kenora and Rainy River District hiring requirements forecasts.

Sub-provincial forecasting presents a number of unique challenges that do not exist in preparing forecasts at provincial and national levels. These include limited access to data from traditional Labour Market Information (LMI) data sources; high labour mobility; and the fact that workers may live outside the region in which they work (and vice-versa). To address these challenges in its methodology, MiHR adapted a number of provincial assumptions to produce district-specific data. Adaptation was based on the outcomes of surveys; key informant interviews conducted as part of this research; and information from each planning board’s own research and data collection activities within the district.6

Industry Definition and Scope
For the purposes of its forecasts, MiHR defines the mining industry as including all phases of the mining cycle: exploration, development, extraction, processing and reclamation. The MiHR forecasts presented here include: exploration, mining and quarrying; support services and contractors (not including oil and gas); iron and steel mills and ferro-alloy manufacturing; alumina and aluminum; and other non-ferrous metal production and processing.

The industry is mainly defined using North American Industry Classification Codes (NAICS) and National Occupational Classification for Statistics (NOC-S) codes. Statistics Canada and other LMI sources organize their data according to these classification codes. Together, the NAICS and NOC-S systems allow MiHR to group statistics to obtain estimates of employment and workforce demographics. Details on the NAICS and NOC-S codes included in the forecasts are found in Appendix B.

Each district was defined according to Statistics Canada’s economic districts as shown in Figure 1. Findings from primary research were used to further define local scope; set region-specific context; verify and validate data from other sources; determine the unique occupational structure of the local workforce; and provide local measurements of diversity, workforce mobility, turnover and average age at retirement. To acquire this local information, MiHR reached out to industry stakeholders in the districts through a survey on mining industry profile, labour market needs and human resources trends.

District Research
In the Kenora and Rainy River Districts, 10 employers participated in surveys and interviews. Despite what seem on the surface to be low numbers, main industry employers were appropriately represented in this cross section. Stakeholders included government, education, industry associations and employers in extraction, exploration and development, and in mining support-services sectors. These inputs guided MiHR to validate and adjust assumptions used in its employment modelling and forecasts for the districts.

6 The forecasts presented herein provide custom estimates for the region, based on current information available at the time of production.
Figure 1 — Ontario Districts
Economic Overview and Regional Labour Market
The global economic recovery stalled due to increased uncertainty in the second half of 2011; as a result, the outlook for global growth deteriorated in the last two quarters of the year. The key factor underlying this deterioration was the ongoing euro-area sovereign debt and banking crisis. With the continued uncertainty, global exploration and mining activity slowed in 2012, casting a shadow over industry prospects for the near-term.

However, fluctuations are a reality in the mining industry and overall — despite recent activities — the economic outlook is cautiously optimistic. In the United States, the largest single customer for Canadian output and production, the economy has shown signs of a gathering momentum for sustained growth since the fall of 2011. Consumer confidence in the U.S. increased in 2012 from the near-record lows of August 2011 and output growth accelerated in both the U.S. manufacturing and non-manufacturing sectors. In addition, demand for Canadian commodities continues to grow as China, India, Brazil and other nations further develop their economies.

**Canadian Economic Overview**

Canadian exploration activity slackened in 2012 and industry information indicates that exploration expenditures did not meet anticipated levels during the second half of the year. As a result, the exploration and mining sector operated under a blanket of caution in the latter part of 2012. Nonetheless, Canada’s economic outlook remains positive amid continued international uncertainty and a tenuous global recovery. Canadian economic growth is forecast to be modest in the near term and then to gradually and moderately increase over the forecast horizon, as demand for Canada’s natural resources continues.
Canada’s Recent Economic Performance
Canada’s economic performance over the 2008-09 recession and throughout the recovery period has been strong relative to peer countries. This strength reflects Canada’s sound economic, fiscal and financial-sector fundamentals, along with the support provided under the federal economic-stimulus package. As a result, Canada’s real GDP is well above pre-recession levels — the best performance in the G-7 countries.

Canada posted the strongest growth in employment in the G-7 during the recovery period — with both the quantity and quality of new employment exceeding expectations. Overall, Canada has regained the ground in employment lost during the recent recession. About 90 per cent of the added jobs were in full-time positions, with over three-quarters in high-wage industries in the private sector. As of mid-year 2012, Canadian businesses were continuing to hire, even though the federal government’s temporary economic stimulus program had ended.

In an October 2012 update of Canada’s fiscal and economic outlook, the federal government predicted that real GDP growth in 2013 would be lower than private-sector forecasters had projected in early 2012. The forecast called for stronger growth in 2014 and 2015.

The largest impact in Canada of the global economic turbulence has been lower commodity prices. The European crisis and its impact on growing economies, including China, remains a drag on world economies. In North America, however, both Canadian and U.S. governments have indicated they will act as needed to provide stimulus to help sustain recovery. This is a clear message to other countries and to industry to continue to invest in North American economies. In early 2012, investment in Canada was well above pre-recession levels, at an annualized rate of 9.4 per cent.

Mining Industry Economic Overview and Outlook
In sync with other industrial sectors in the economy, the Canadian mining sector’s GDP rebounded in 2010 after 2009’s unprecedented and precipitous decline — increasing by 15 per cent over the levels of the previous year. The sector responded quickly to international demand with strong exports in 2010.

Globalization of international trade and rebounding demand for Canada’s mineral resources have stimulated the industry’s recovery; however, in mid-2011, the uncertainties associated with weak markets returned due to a number of developments, including a slowdown in the U.S. economy and higher than anticipated inflation in China. These trends and others produced a temporary shock to demand for Canadian metals and minerals and resulted in much lower prices.

Despite the sector’s cyclical nature, demand for Canadian metals and minerals is expected to grow in the long term. This prediction arises from gradual but stable economic growth in the U.S. and from the relatively high economic growth rates of China, India and Brazil. These countries’ large domestic markets for Canadian exports of base metals, potash and potassium compounds, and coal bode well for additional incremental demand for Canadian metals and minerals in the near term, as well.

Canadian Mining Industry Employment
The mining industry directly employs over 235,000 people in Canada. Employment in the sector reflects a net increase of 15 per cent during the last six years, or an average increase of 2.5 per cent year-over-year, between 2004 and 2010.
Canadian mining industry employment is sensitive to changes in GDP. Figures 2 and 3 depict this relationship in Canada and in Ontario.

The Northern Ontario Mining Industry and the Ring of Fire

Resource-based industries are a vital part of a strong Northern Ontario economy. The discovery of significant mineral deposits in the Ring of Fire, an area in Ontario’s Far North, presents major development opportunities in mining that will contribute to the Ontario economy. Development of the mineral deposits in the Ring of Fire area will create jobs and better position the Northern Ontario economy for future sustained growth. According to recent feasibility and impact studies, the mine developments currently under consideration in the Ring of Fire are expected to create more than 1,500 permanent jobs, once the mines are in full production. In addition, related jobs will be created in the mining service and supply sector.

Regional Labour Market

The Kenora and Rainy River Districts represent approximately 40 per cent of the Ontario provincial landmass, accompanied by the lowest population density and the lowest population growth in Northern Ontario. The economic development prospects in the districts are promising for the future. However, economic development is a difficult and daunting task due to the lack of infrastructure and land access primarily because of the vastness of the area. This challenge is compounded by geographical factors such as an untamed wilderness, frozen muskeg and boreal forests.

As reported in the 2011 Census, populations continue to decline in the Kenora District (down 11 per cent since the last Census) and in the Rainy River District (down 2 per cent). These declines coupled with high levels of youth out-migration pose serious challenges to the Kenora and Rainy River Districts labour market. In addition, part of the region’s workforce consists of workers who regularly fly in and out of the districts to western Canada for employment.
Kenora and Rainy River Districts’ Aging Mining Workforce
The Kenora and Rainy River Districts have a long mining history with current activities in precious metal mining and granite quarries contributing to the region’s economy. Industry growth and new activities will be curtailed and demand for workers in the Kenora and Rainy River Districts will be exacerbated if key issues are not addressed. These relate to labour shortages due to an aging workforce, increased competition for skilled workers and declining enrolment in mining-related academic programs.

Industry stakeholders indicated that employment in mining industry support activities and in non-metallic mineral product manufacturing increased in 2011 — through hiring by the districts’ small- and medium-sized employers. Regional respondents to MiHR’s Fall, 2012, survey questionnaire indicated that employment in mining, exploration, development and support activities will likely increase in the region beginning in 2013. Over half of surveyed employers reported business conditions as favourable and expected conditions to improve in the year ahead. Some employers anticipate workforce needs in advance and most react quickly (within 6 months) to economic conditions.

The aging labour force is a factor in the districts; in the Kenora District, the median age of the population is 39 and in the Rainy River District, it is 43. Findings from MiHR’s survey of employers7 revealed that the average age of respondents’ workforces was 34 years old, with some employers reporting an average age of as young as 22. Mining sector workforces tended to be older; whereas exploration and support services employers reported younger workforces; a pattern observed elsewhere in the Canadian mining industry. Most employers reported between 0 and 10 per cent of their workforces are eligible to retire in the next 12 months, with between 0 and 10 per cent more becoming eligible over the next 3 years, and another 10 per cent eligible in 3 to 5 years. The average age of retirement is not tracked by many respondents, but the few who do track it reported a retirement age of about 65 years. Generally, across the country, MiHR research has found that exploration and support services employers report older retirement ages than extraction employers.

The out-migration of younger people from the Kenora and Rainy River Districts exacerbates the already precarious state of the districts’ aging workforce. For example, during the five years between 2005 and 2010, the two districts experienced a net out-migration of about 5,000 adults; more than half (60 percent) of this exodus involved adults between the ages of 18 to 44. This presents a challenge to establishing planned industry-and-skill-specific education and training that require long lead times.

Respondents indicated that approximately 68 per cent of their non-Aboriginal workforce live in the region, with some employers reporting as much as 100 per cent local workforces and others reporting as few as 10 per cent. Workers mainly commute into the region from elsewhere in Ontario, with some employers reporting as much as one half of their workforce commuting from British Columbia, Manitoba, Quebec, and Nova Scotia. Turnover or churn was reported at about 17 per cent for employers, but ranged between less than 1 per cent to as much as 60 per cent, depending on the employer’s activities and operating context. In both surveys and focus group sessions, the districts’ employers flagged Alberta as a popular draw on local talent.

---

7 Survey response rates were too small to report findings for each district individually. District outcomes are reported in aggregate to ensure that no findings can be attributed to an individual employer.
Respondents to MiHR’s survey reported that on average 35 per cent of their workforce is at a high school level of education, 20 per cent have completed college education, 18 per cent have received trade certification and just over 40 per cent have a university level of education. This profile of education, with large proportions of the workforce in professional level occupations, is directly a reflection of a large exploration workforce. A handful of employers reported outsourcing at least one component of education and training for their organization, including health and safety, and skills development training.

Employers in the region rely most heavily on online job boards, company websites and internal employee referrals when recruiting talent. Job fairs and newspaper ads are also used. Very few employers reported using social media, word of mouth, radio or TV, or direct recruiting from schools to find talent.

**Kenora and Rainy River Districts’ Potential to Employ Aboriginal Peoples and Other Diverse Groups**

The Kenora and Rainy River Districts are home to 65 Aboriginal communities. It ranks first in Ontario for the largest concentration of Aboriginal people in an urban area — representing 16 percent of the total municipal population. Aboriginal people represent 40 percent of the districts’ population overall.

The skills gap, which is common in Aboriginal communities across Northern Ontario, is a factor in the Kenora and Rainy River Districts and precludes greater participation by Aboriginal workers in the mining sector. In addition, the education level of the Aboriginal population in the Kenora and Rainy River Districts is significantly lower than that of the general population. Over 50 per cent of Aboriginal people aged 25 to 34 in the two districts do not have an Ontario Secondary School Diploma.

Literacy and skills development measures are required for Aboriginal people and other diverse groups to enhance employability and to develop a skilled, inclusive and adaptable workforce. Efforts are underway to include the Aboriginal communities in the districts’ development, such as the recently signed partnership agreements for higher levels of Aboriginal community engagement.

Responses to MiHR’s survey showed that nearly 13 per cent of mining workforces are Aboriginal peoples; with a range of 5 per cent to as much as 30 per cent. Note that these are averages from a sample of employers and not all employers responded to this question—it is assumed that participation could be much higher in individual companies, particularly those with partnership agreements with local communities. Stakeholders from industry, education, and communities expressed an opportunity for local employers to continue and increase collaboration with Aboriginal communities to expand the limited skilled labour pool.

Other demographic characteristics of the survey respondents’ workforces are similar to the national patterns observed for mining. About 18 per cent of respondents’ workforces are female with a range of less than 1 per cent to as much as 50 per cent.

Employers reported less than 3 per cent of their workforces are new Canadians or temporary foreign workers, with a range of none to 6 per cent. Settlement of new Canadians in the Kenora and Rainy River regions has decreased over the last 30 years. The settlement rate significantly decreased after the 1980s and remained virtually non-existent throughout the 1990s and 2000s. Future immigration policy can be used as a tool to attract new Canadian workers with the requisite skill levels to the Kenora and Rainy River Districts, to help them develop.
Kenora and Rainy River Districts
Hiring Requirements

23

Kenora and Rainy River Mining Districts
Hiring Requirements Forecasts 2013
MiHR research indicates that employment in the mining sector is more cyclical than in many other industries in Canada.\(^8\) Previous labour market forecasts produced by MiHR show that despite this cyclical nature, future hiring requirements will be quite significant across Canada, even under contractionary (i.e., poor economic outlook) scenarios. MiHR’s projections for all of Canada forecast mining hiring requirements ranging from 118,600 to 196,300 workers over the next decade. Even with a very moderate outlook, MiHR’s baseline scenario for the mining industry predicts the need to hire approximately 147,400 workers over the next 10 years.

Projections for Ontario mirror the national trends. The range for Ontario mining hiring projections is an estimated 51,600 to 65,800 workers. Even under a moderate hiring outlook (the baseline scenario), MiHR projects the need to hire over 59,000 workers in Ontario over the next 10 years — slightly shy of one-third of the total mining hiring requirements for all of Canada.

These same trends are evident in the labour market forecast for the Kenora and Rainy River Districts; even under a contractionary scenario — where total employment in the districts’ mining sector increases by a slight 3 per cent — almost 3,500 workers will need to be hired to offset workforce attrition due to retirements and other separations.

---

\(^8\) Canadian Mining Industry Employment and Hiring Forecasts, 2011.  
Cumulative Hiring Requirements Forecast

Mining sector employment in the Kenora and Rainy River Districts was estimated at over 5,800 workers in 2012. Under the baseline scenario, total employment by 2022 is forecasted to be almost 6,400 — an increase of 9 per cent. Under the baseline scenario, the projected cumulative hiring requirements over the next 10 years will be approximately 3,930 workers. A projected 3,460 workers would be needed in a contractionary scenario, and 4,410 workers in an expansionary scenario.

Tables 1a and 1b show forecasted hiring requirements for the Kenora and Rainy River Districts’ mining industries under three scenarios — baseline, contractionary and expansionary. (Details on scenario development and assumptions can be found in Appendix A).

Hiring Requirements Forecast By Occupation

The occupational hiring requirements for the Kenora and Rainy River Districts are presented in Tables 3a and 3b by broad occupational category. Occupational hiring requirements are based on the current occupational structure of the mining sector and may over- or under-estimate needs for each occupation, as new mines come online and the occupational structure of the mining workforce shifts over time. Such a shift would occur, for example, when mine development moves from the construction phase into the production phases.

The estimates in Tables 3a and 3b provide an indication of needs for training and other supports in the Kenora and Rainy River Districts, in particular occupational groupings. MiHR includes 66 key occupations in its occupation-level analysis of forecasts. These occupations represent just over 70 per cent of all employees in the mining sector and are carefully selected to represent a broad spectrum of jobs that are considered essential to the industry. Occupations listed in the “other” category are considered non-specific to mining; these are jobs also commonly found in other sectors (e.g., cleaning and janitorial positions, non-specific administrative roles, nurses and other roles).

An occupation-specific breakdown of the needs within each category is possible. These are presented in Appendix B, but should be interpreted with caution, given the smaller region-specific data set. Occupational needs will adjust over the forecast period and be mainly driven by the specific context of the mining operations that develop in the region. All occupation-specific data has been rounded to the nearest 5 workers.

(Estimates may not add perfectly due to rounding.)

These requirements can be broken down even further by individual NOC-S codes and this breakdown is shown in Table 4. It should be noted that breakdowns are shown for the two districts combined—with smaller regional-specific data sets, such as the ones used here, the error margins for an occupation-specific breakdown are high and the forecasts should be interpreted with caution.

¹⁰ An occupation-specific breakdown of the needs within each category is possible. These are presented in Appendix B, but should be interpreted with caution, given the smaller region-specific data set. Occupational needs will adjust over the forecast period and be mainly driven by the specific context of the mining operations that develop in the region. ### Notable Trends and Potential HR Issues

As shown by the forecasts and trends presented in this report, the mining industry in the Kenora and Rainy River Districts faces a number of potential HR issues. These include:

- **On an occupational basis, the greatest hiring requirements for the region are in the “trades and undesignated occupations.”** This is consistent with the requirements that MiHR has found across the country. The production and extraction phases of mining are labour-intensive and workers in these roles will become more mobile. This pressure is expected to be even higher for the Kenora and Rainy River Districts, given the strong “pull” factors from other regions of the province, as well as from the other parts of Canada.

- **The category with the second-greatest hiring requirements is “supervisors, coordinators, and foremen.”** These supervisory roles are normally occupied by employees with significant experience in the industry. The fact that a majority of these experienced workers are eligible to retire over the next decade underscores a key replacement challenge — the need to attract and retain new employees now, to provide them with the opportunity to build their depth of experience and develop the competencies for the supervisory roles they will need to assume.

- **It is worth noting that the age demographics of the exploration workforce are somewhat different than those of the extraction workforce.** Workers in exploration, particularly in geoscience and technician roles, tend to retire slightly older at age 62. However, there is evidence that this segment of the mining workforce lacks workers in the mid-career age categories (35-45 years). With the significant level of exploration activity in the region, this trend may add to the challenge of finding experienced geoscientists and geological technicians to meet future hiring needs.

- **Aboriginal peoples are an important source of talent for the Kenora and Rainy River regions.** Many employers in the region have proactive strategies to engage and develop the talent potential that exists in local Aboriginal communities. Stakeholders indicated that local communities are well informed and cautiously optimistic about future employment opportunities. That said, the need for employment in many Aboriginal communities is immediate, yet many advanced-development projects are still several years from entering production stages. Stakeholders offered examples of positive steps that could be taken to keep local communities interested in the opportunities to come, such as assisting and supporting communities through the intervening years and proactively providing training activities for future employment.
Aboriginal talent tends to be under-utilized in all sectors across Canada. In mining, Aboriginal employees are employed primarily in labour and support roles. Industry and education partnerships to provide advanced education opportunities for members of local Aboriginal communities could potentially ease the pressures that the Kenora and Rainy River District employers will experience — as they attempt to source critical talent for jobs in the physical, sciences and engineering, and in technician roles.

Immigration will continue to be another key source of talent for the district. Mining is a global industry and many skilled workers are already coming to Canada to find opportunities; however, new Canadians tend to settle in large urban centres. Survey responses indicated that mining employment of new Canadians in the districts (4 per cent) is well below the national average, which is 8.7 per cent. Employers in the district may achieve positive results by implementing strategies to attract immigrant talent from large cities.
Available Talent — Ontario
A natural reaction to MiHR’s hiring requirements forecasts is a desire to know more about potential sources of talent to meet the projected needs. MiHR has recently developed new forecasting capabilities to project total available talent for the same 66 key mining occupations included in its hiring requirements forecasts. Currently, these talent projections have been developed at the provincial level only — largely due to challenges with reliably tracking mobility rates at a sub-provincial level.

While MiHR is not yet able to disaggregate these forecasts to a regional level, the provincial-level projections can provide an indicator of the needs of a specific region, assuming that the region will attract a portion of the talent available to the province as a whole. The numbers presented here are intended to provide insights into the gaps that the Kenora and Rainy River Districts can expect to face in meeting their hiring needs over the next decade. They also help to inform the recommendations at the end of this section on ways to increase the region’s share of available talent, as well at potential strategies to grow the talent pool.

Forecasting Talent Availability for the Province of Ontario

MiHR’s model for Available Talent includes specific occupations identified as critical to the mining industry. The model first projects the pool of labour that the mining industry is expected to draw from — for each occupation — and then predicts the proportion of that pool that the industry will successfully attract in a given year.

The share of talent that the mining industry is able to attract varies among occupations — depending on how specific an occupation is to the mining industry. For example, the mining industry has historically attracted approximately 100 per cent of underground mine service and support workers but only 3 per cent of HR specialists. The predicted share for the mining industry is based on historic patterns — reflecting mining’s traditional capacity to attract and retain talent compared to all other industries drawing from the same occupation pool. Talent share is typically stable over time. As the mining industry attempts to increase its own share, it is likely that competition from other industries will intensify in response.
Available Talent for Ontario Mining

Although a number of the occupations included in the data set are specific to mining, many are not; therefore, total supply of talent was forecast by occupation across all industries. This allowed MiHR to assess the potential pool of Ontario workers available to the mining industry. The analysis estimates the number of workers in each occupation that are historically attracted to employment in mining — permitting an assessment of the relative tightness of the mining labour market for each occupation.

MiHR forecasted annual supplies of workers in all industries across all 66 occupations, and estimated the mining industry’s share of the talent pool based on historic trends of the flow of workers into the mining industry.

The available talent for each occupation can be reasonably estimated using predictions for new entrants into the labour market — based on migration trends, school leavers and people re-entering the labour market. This model assumes relative equilibrium in current supply. It also assumes that those already employed or seeking employment will remain in the province (not necessarily with the same employer) or be captured as exiting the labour pool in “exit” estimates. Using this stock and flow model, new entrants represent the pool of available talent to fill hiring needs over the forecast horizon.

Table 5 shows the availability of talent over a two-, five-, and ten-year horizon for the province of Ontario. According to model projections, there will be approximately 509,800 new entrants into Ontario’s labour force for the selected 66 occupations. Historically, the mining industry in Ontario has attracted 3 per cent of new entrants. Assuming this rate remains constant, Ontario’s mining industry can expect to attract 14,900 new entrants over the next 10 years.

(Estimates may not add perfectly due to rounding.)
Addressing the Gaps
Addressing the Gaps

Just as the nature of talent gaps differs among occupations, so do the strategies to address the gaps. The responsibility to develop and implement these strategies does not rest with industry employers alone, but also with industry associations, community stakeholders, educational institutions, and governments. By working together to support mining’s ability to attract talent, stakeholders will enable a key economic sector to progress, to the benefit the Ontario economy as a whole.

Increasing Mining’s Share of Available Talent

In some cases, industry, education and government must aim to attract more entrants from an existing pool (i.e., carve out a larger slice of the talent pie); however, this is not an easy undertaking. As mining competes for more of its traditional share of the talent pool, other industries will respond with attempts to maintain or expand their own shares; the competition for talent will simply increase.

Furthermore, as the competition for talent heats up, other complications arise. For example, workers become more mobile and look for options in other sectors or other regions. In some cases, employers feel driven to offer higher salaries and increased benefits in a bid to retain talent. These strategies may result in short-term gains but quickly become unsustainable.

To address these types of gaps, employers, educational institutions and governments can:

- Work together to promote careers in Ontario mining to youth, workers in other provinces and new immigrants.
- Support the career-awareness and outreach activities of various associations, such as the local planning boards.
- Adopt a consistent industry brand that promotes positive impressions of mining careers and dispels myths. MiHR’s Explore for More brand can be readily adapted to provincial and regional needs.
- Coordinate and expand initiatives to engage, educate, train and provide employment opportunities for under-represented and under-utilized segments of the labour force, such as women, new Canadians, and members of local Aboriginal communities.
- Create a community of practice to share experiences, initiatives and practices, and to create synergies among regional employers in attracting new talent. For example, collaborative and cooperative hiring campaigns and career fairs could be held within Ontario and in other provinces, to inform skilled workers outside the region about the mining employment opportunities that exist within the region.
Growing the Talent Pool

In other cases, there simply aren’t enough people in the talent pool to meet the mining industry’s needs. The industry and its counterparts in education and government must strive to increase the number of entrants and grow the talent pool (i.e., make the pie bigger). These solutions are generally long-term and require coordinated and streamlined efforts among employers, government, educators and industry associations.

Targeted efforts to re-attract retirees and retain mature workers have proven to be good mitigation strategies where talent — particularly experienced talent — is not yet available. These efforts ensure that an already small labour pool does not shrink further and that experienced workers remain in the workforce to mentor younger workers and rapidly increase their future potential in the workforce.

Possible approaches to growing a talent pool include:

- Government, employers and educators could explore ways to increase flexibility in apprenticeship and skills-training programs to develop new workers at a faster rate, without compromising quality of training.

- Enhance participation and collaboration by all stakeholders — especially employer representatives — in local education task forces, planning boards and committees.

- Coordinate industry efforts with local educational institutions to provide work-experience programs and encourage graduates to remain in the local area.

- Develop a communication strategy targeted at public and separate schools to promote the mining sector as an employer of choice, working with key educators (e.g., principals, guidance counsellors and teachers) to integrate mining curriculum and programming, and expanding upon the work of the Prospectors and Developers Association of Canada’s (PDAC’s) Mining Matters.

- Invest in pre-employment and in-house training programs to ensure equal opportunities for all communities of interest, as well as smooth transitions from training to employment.
Appendices
This appendix outlines the methodology used by MiHR to produce forecasts of hiring requirements in the mining industry at the national and provincial levels. A flowchart depicting this methodology is provided in Figure A1. It also describes the model specification and various data used to develop the Kenora and Rainy River Districts’ forecasts.

Models of employment were estimated based on the following six steps:

- **Step 1**: Collect and analyze Statistics Canada, Labour Force Survey and other secondary data on commodity prices, labour productivity and population demographics that may potentially explain changes in the number of jobs in the region.

- **Step 2**: Determine the driver(s) that explain the greatest level of variation in the number of jobs by testing various model specifications through regression analysis.

- **Step 3**: Produce baseline, contractionary and expansionary forecasts for each driver determined in Step 2.

- **Step 4**: Combine Steps 2 and 3 to produce the forecasts for employment under baseline, contractionary and expansionary scenarios.

- **Step 5**: Produce forecasts of the total hiring requirements given the change in employment (determined in Step 4) and estimates of retirement and non-retirement separation rates.

- **Step 6**: Calculate and apply occupational coefficients to produce estimates of hiring requirements by occupation.

- **Step 7**: For the Kenora and Rainy River Districts, the provincial-level forecast prepared in the previous steps is adjusted, based on data inputs for the districts, including anticipated major projects expected to go into production, differences in the age structure of the population and levels of labour mobility.

Forecast Methodology

MiHR’s forecasts are based on an economic model that combines a number of factors, including labour productivity, changes in commodity prices, retirement rates and non-retirement separation rates. Using a combination of independent economic forecasts and information from industry stakeholders, the model translates these factors into forecasts of mining employment and hiring requirements over a 10-year period.

The Kenora and Rainy River Districts’ hiring requirements forecasts are the result of adjusting and partitioning the hiring requirements forecast from MiHR’s provincial model for Ontario and injecting region-specific intelligence from other data sources. The provincial model was customized using data from Statistics Canada’s 2011 Census, Labour Force Survey data, and data collected in the district — triangulated with data from key informant interviews and a survey of industry employers.
Labour Productivity
Labour productivity is influenced by various factors and trends that affect the level of a sector’s output over time — for example, technology advancements and training can increase workers’ productivity. On the whole, labour productivity has an inverse relationship with the overall level of employment. As productivity grows, the sector is able to “do more with less,” which means that higher levels of productivity tend to be associated with contractions in employment needs. In the model, the Kenora and Rainy River Districts’ mining labour productivity is assumed to be identical to the productivity forecast for the Ontario mining industry as a whole.

Minerals and Metals Prices
Mining employment in Canada tends to be more volatile than in many other sectors, making long-term workforce planning more challenging. In large part, the volatility of mining employment is a result of reactionary workforce adjustments — due to the large and sometimes unpredictable fluctuations in the prices and demand for mining commodities. MIHR research demonstrates a strong positive correlation between movements in commodity prices and the overall level of mining employment in Canada.

As a result, the model includes a consensus on minerals and metals prices for the forecast period that was custom-designed for use in the MIHR system. Authorities contributing to this consensus include the World Bank, Bank of Canada, private sector Canadian banks and commodity-specific economic analysis consultancies.

Retirement Rate
Over the next decade, the entire Canadian labour force is facing a looming wave of retirements, as members of the baby-boom generation become eligible to leave the workforce. However, it is difficult to predict the timing of retirements. The decision to retire is a complex one and each individual considers a number of factors such as financial goals, levels of debt and savings, family circumstances, health status, retirement policies and other labour market pressures. The complex nature of individual retirement decisions is an important factor when developing predictions for future retirement rates.

MIHR uses a conservative approach when estimating retirement rates. Historical retirement ages are considered and a profile of expected retirement is created based on the age demographics of the region. For this forecast, the demographics for the province of Ontario are used as a basis for the districts’ age demographics, but these were adjusted, taking into account local industry inputs.

Non-Retirement Separation Rate
The non-retirement separation rate captures important movement and churn in the labour market that are not directly related to a change in the overall level of employment. This variable includes, for example, individuals leaving the mining industry in the Kenora and Rainy River Districts for another industry sector or for the mining industry in another region, as well as people leaving the labour force for other non-retirement reasons such as death or disability, or to return to school.

A challenge inherent to forecasting labour markets on the district level is the fact that the relatively small geographic area of a regional-level analysis dictates that workers’ mobility should be considered. Workers are exceptionally mobile within a region, as compared to the provincial and national levels of analysis. They are able to live in an outside region while working in the Kenora and Rainy River Districts or to easily travel from the district to other regions to work.
This makes developing a non-retirement separation rate for the region difficult and poses challenges around how workers should be counted. Should they be counted based upon where they contribute to the economy through spending and living, or based on where they work and contribute through an employer’s spending and investment in the region? In this forecast, individuals are counted on the basis of where they live.

These challenges are unique to the analysis of a district’s labour market. As a result, MiHR has adopted conservative forecast estimates that were validated through industry consultation. In order to reflect the significantly higher labour mobility at the district level, MiHR doubled the assumed non-retirement exit rate used for the provincial forecasts — from 2 to 4 percent.

**Forecast Scenarios**

This report presents three forecast scenarios that adjust assumptions to illustrate a range that the hiring requirements may take over the forecast period. The baseline scenario uses a consensus forecast for commodity prices and productivity changes over the forecast period. Accounting for the consensus forecasts, the baseline scenario is the most likely path that hiring requirements will take — given the assumptions listed above and current operating environments. The expansionary scenario assumes that commodity prices are stronger than the consensus forecast (leading to increased mining activity) and that labour productivity is lower than the historic trend — providing an upper boundary for the hiring requirements forecast. Conversely, the contractionary scenario assumes commodity prices that are weaker than the consensus forecast (leading to less mining activity) and labour productivity higher than the historic trend — providing a lower boundary for the hiring requirements forecast.

In addition to model inputs, information from key informants, Statistics Canada, Natural Resources Canada and MiHR research was incorporated to develop the forecast for mining employment in the districts. In particular, the baseline scenario assumes that known advanced development projects will move forward as currently predicted. The model and resulting hiring requirements forecasts are deliberately conservative, taking into account the uncertainty in the economic cycle. This approach assumes that mine development may take longer than the forecast period as projects move through construction and into production phases.
This Appendix lists the North American Industry Classification Codes (NAICS) and National Occupational Classification for Statistics (NOC-S) codes used throughout this report to define the mining industry. MiHR is engaged in ongoing, iterative research to include more NOC-S codes in this definition of the sector and to better capture Statistics Canada data related to the mining-industry workforce.

**Industry Definition and Scope**

Statistics Canada, the main source of Canada’s labour market information, uses two different coding systems to classify employment data: the North American Industry Classification System (NAICS) and the National Occupational Classification for Statistics (NOC-S). Both systems provide a hierarchical structure that divides higher-level categories into more detailed categories, in order to group similar establishments and individuals.

NAICS codes are used by statistical agencies throughout North America to describe economic and business activity at the industry level. The system features a production-oriented framework where assignment to a specific industry is based on primary activity, enabling it to group together establishments with similar activities.

The NOC-S system was developed by Statistics Canada and Human Resources and Skills Development Canada (HRSDC) to provide standardized descriptions of the work that Canadians perform in the labour market. NOC-S codes organize labour-force participants according to the nature of work they perform, thereby enabling similar occupations to be grouped. NOC-S codes are specific to Canada.

There is no single NAICS code that directly corresponds to all phases of the mining cycle (exploration, development, extraction, processing and reclamation). Similarly, there is no single set of NOC-S categories that pertains only to mining. People employed in occupation groups that are prevalent in mining also work in a variety of other industries. Together, the NAICS and NOC-S systems provide a means for grouping statistics to obtain estimates of employment and workforce demographics using Statistics Canada data sources. A full description of both classification systems can be found on Statistics Canada’s website.

**The Mining Sector**

MiHR has defined the sector according to the following NAICS codes, thereby providing the best correspondence between the industry’s main primary and processing activities as defined by Natural Resources Canada. The NAICS codes that define the mining industry include:

- **NAICS 212: Mining and Quarrying (except Oil and Gas)** — This subsector comprises establishments primarily engaged in mining, beneficiating or otherwise preparing metallic and non-metallic minerals, including coal.

- **NAICS 213: Support Activities for Mining and Oil and Gas Extraction** — This subsector comprises establishments primarily engaged in providing support services, on a contract or fee basis, required for the mining and quarrying of minerals and for the extraction of oil and gas. Establishments engaged in the exploration for minerals, other than oil or gas, are included...
- NAICS 3311: Iron and Steel Mills and Ferro-Alloy Manufacturing — This industry group comprises establishments primarily engaged in smelting iron ore and steel scrap to produce pig iron in molten or solid form.

- NAICS 3313: Alumina and Aluminum Production and Processing — This industry group comprises establishments primarily engaged in extracting alumina.

- NAICS 3314: Non-Ferrous Metal (except Aluminum) Production and Processing — This industry group comprises establishments primarily engaged in smelting, refining, rolling, drawing, extruding and alloying non-ferrous metal (except aluminum).

- NAICS 5413: Professional sciences and consulting including geosciences, environmental engineering, geophysical surveying and mapping, assay and chemical analysis laboratories, and other surveying and mapping activities.

**Occupation Classification**

Listed below are the 66 NOC-S codes that MiHR uses to define the occupations that are essential to the exploration and mining sector. Note that the occupation titles listed below are those used in the Statistics Canada system. Often an occupation can have multiple titles and Statistics Canada offers a means to map or connect job titles back to the proper NOC-S code, found on the Human Resources and Skills Development Canada website (specifically the “Quick Search” box).11

For example, a “Quick Search” for “Haul Truck Driver — underground mining” shows that this occupation maps directly to “Underground mine service and support workers”. The site will also show which job titles are listed for each occupation category. For example “Heavy equipment operators (except crane)” includes job titles such as: apprentice heavy equipment operator; heavy-duty equipment operator; heavy equipment operator; operating engineer, heavy equipment; ripper operator — heavy equipment; shovel operator — heavy equipment; spreader operator — heavy equipment; stacker operator — heavy equipment.
